CIS Transport System

The CIS transport system is modular in design. It is easily erected into 20 or 40 foot containers in less than 10 minutes with no tools required. The garments arrive in the original condition from the manufacturer and do not require expensive pressing and reprocessing. A full container of garments on trolleys can be emptied in around 5 minutes and the storage system packed up ready for return to the manufacturer 10 minutes

later. The system can also be adapted for use inside 20 or 40 foot trucks.

Flat Pack Storage

Appcon also supply and install all types of flat pack materials handling systems from pallet racking to long span shelving from a range of suppliers like Dexion, Colby, Brownbuilt, Schaefer and more. Appcon design, supply and install flat and spiral conveyor systems where minimal floor space is available.

Picking Trolleys

Appcon manufacture and supply standard type picking trolleys or custom make to specific requirements with onboard scanning and processing including pick to light rails in partnership with major equipment suppliers.

Products & Services

- Hung garment warehousing storage equipment.
- System relocations and valuations.
- Rail and Picking trolleys.
- Garment and box conveyors.
- Shelving and pallet racking.
- Vehicle loading and unloading booms
- Mezzanine floors
- Elevators and automated loading systems.
- Overhead bi-lateral chain conveyors
- Picking trolley's and storage stillages
- Programmed/preventative system maintenance.
- Manual & Automatic bagging units.
- Slick Rail.
- General Engineering works.
- Folding hammocks.
- Laundry systems.
- Quality service and spare parts
- Custom made equipment manufactured to order.
- OH&S procedures are available on all Appcon equipment and installations.

Railing & Racking Storage Systems

Rail systems are designed to maximise the storage and through capacity in a designated area. The physical size of the trolley (skid) component makes for easy and space saving storage when not in use,

creating a safe, clean and obstruction free environment. Rail systems are customised and tailored to suit the customers individual needs and working procedures. The systems are designed to produce maximum efficiency to save the customer money by reducing production costs. Systems can include a high degree of automation if required to further reduce production costs.

Mezzanine Floors

With a single or double mezzanine floor similar to the one's pictured you can double or triple your existing warehousing space for a lot less than you might expect. Mezzanine floors can be usually be installed over the top of an existing railing system if required. Mezzanine floors are very cost competitive and usually pay for themselves within a 18-24 month period, calculated on warehouse rental alone without additional off site administration or site relocation costs.
